Contents

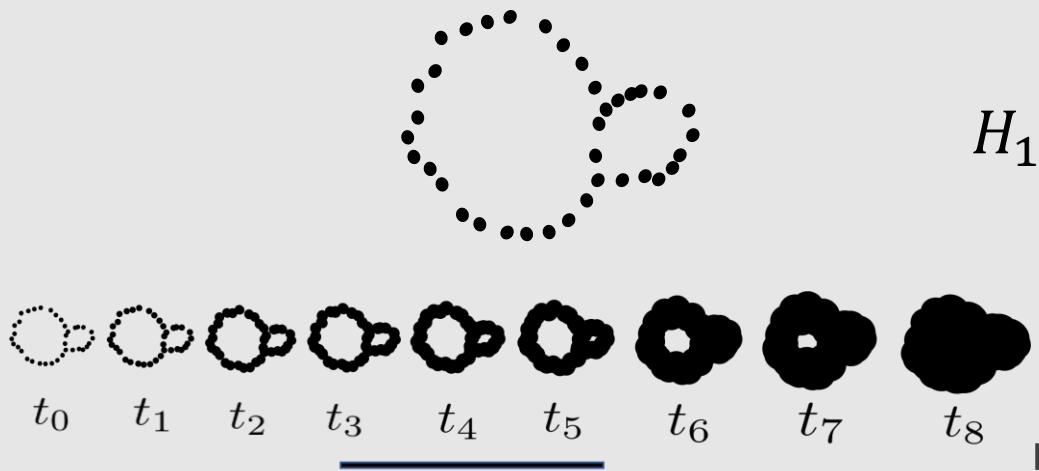

■ Persistent homology ?

■ Three results

Persistent homology

Focus on the "persistence" of the shape
(connected components, holes or voids) of data.

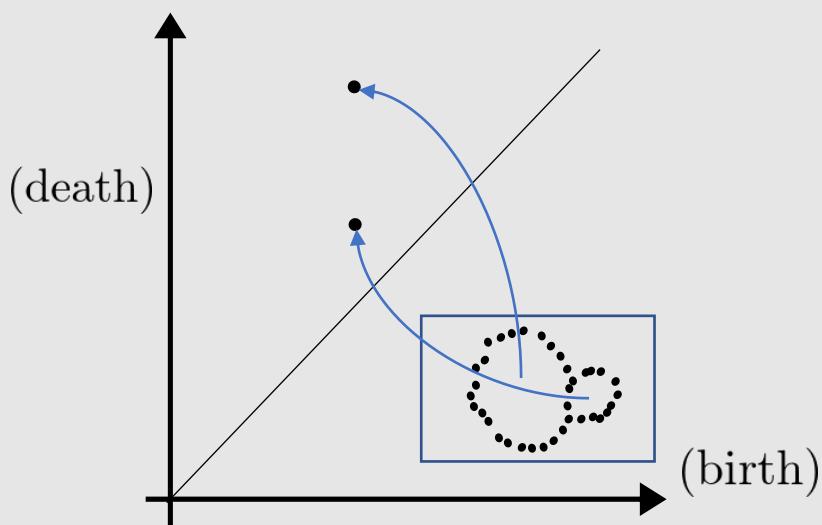

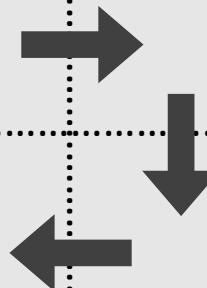

$$H_1(-, k)$$

Persistence module
(over A-type quiver)

$$V : V_1 \rightarrow \dots \rightarrow V_8$$

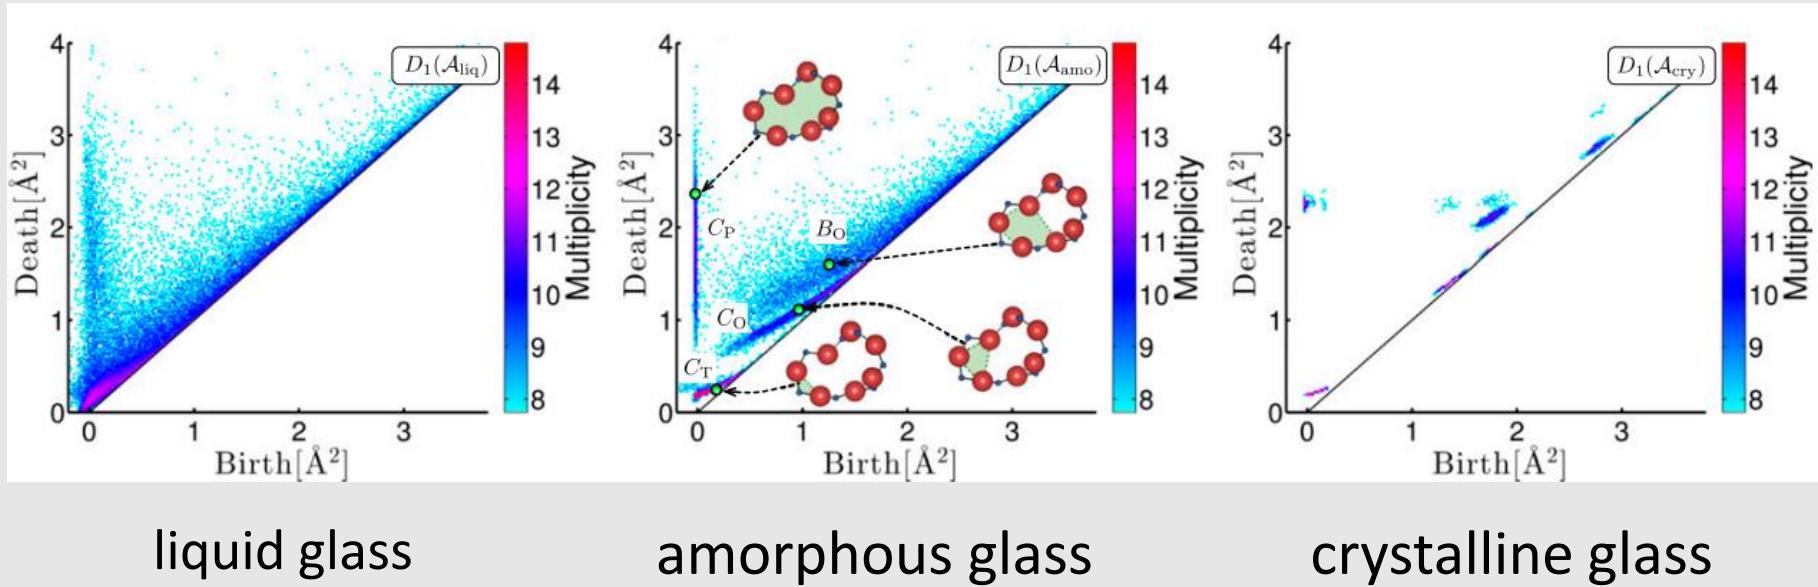

Persistence diagram

Decomposition
(Gabriel's theorem)

$$V \cong \bigoplus_{i=1}^n I[b_i, d_i]^{m_{b_i, d_i}}$$

Example in material science

liquid glass

amorphous glass

crystalline glass

Hiraoka, Y., Nakamura, T., Hirata, A., Escolar, E. G., Matsue, K., & Nishiura, Y. (2016). Hierarchical structures of amorphous solids characterized by persistent homology. *Proceedings of the National Academy of Sciences*, 113(26), 7035-7040.

Zigzag persistence module / Interval decomposability

$$\begin{array}{ccccccc} \bullet & \rightarrow & \bullet & \rightarrow & \bullet & \rightarrow & \bullet \\ X_1 & \subset & X_2 & \subset & X_3 & \subset & X_4 \subset X_5 \end{array} \quad \longrightarrow \quad \begin{array}{ccccccc} \bullet & \leftarrow & \bullet & \rightarrow & \bullet & \leftarrow & \bullet \\ Y_1 & \supset & Y_2 & \subset & Y_3 & \supset & Y_4 \subset Y_5 \end{array}$$

Question

P : Posets of type A

Modules over P are interval decomposable
(by Gabriel's theorem).

$\bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet$

$\bullet \longleftrightarrow \bullet \longleftrightarrow \bullet \longleftrightarrow \bullet \longleftrightarrow \bullet$

$$V \cong \bigoplus_{i=1}^n I[b_i, d_i]^{m_{b_i, d_i}}$$

P : ?

Modules over P are interval decomposable.

Results

(1) Classification of posets

(2) Direct summand injectivity

(3) Monotonicity

Persistence module (1/2)

- Let P be a finite partially ordered set (poset).
(we see it as a category by $a \leq b \Leftrightarrow \exists ! a \rightarrow b$)

•

Persistence module (1/2)

- Let P be a finite partially ordered set (poset).
(we see it as a category by $a \leq b \Leftrightarrow \exists ! a \rightarrow b$)
- *Persistence modules over P* are functors from P to $k\text{-mod}$.
(We call them modules for short.)

Persistence module (1/2)

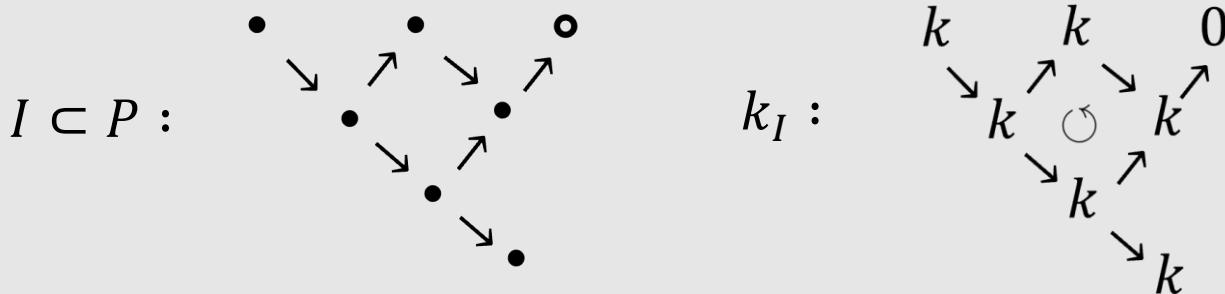

- Let P be a finite partially ordered set (poset).
(we see it as a category by $a \leq b \Leftrightarrow \exists ! a \rightarrow b$)
- *Persistence modules over P* are functors from P to $k\text{-mod}$.
(We call them modules for short.)

Example.

$V_1 \rightarrow V_2 \rightarrow V_3$ is a module over $P: 1 \rightarrow 2 \rightarrow 3$, where each V_i is a finite dimensional k -vector space.

Intervals (2/2)

- A full subposet I of P is called *interval* if I is
 - (1) connected (the Hasse diagram of I is connected),
 - (2) convex ($x \leq y \leq z$, and $x, z \in I$ imply $y \in I$).
-
-

Intervals (2/2)

- A full subposet I of P is called *interval* if I is
 - (1) connected (the Hasse diagram of I is connected),
 - (2) convex ($x \leq y \leq z$, and $x, z \in I$ imply $y \in I$).
- For an interval I of P , the *interval module* k_I is defined by
 $k_I(p) := k$ for $p \in I$, otherwise $k_I(p) := 0$,
 $k_I(a \rightarrow b) := \text{id}_k$ for $a, b \in I$, otherwise 0.
-

$$I \subset P : \quad \begin{array}{c} \bullet \\ \downarrow \quad \nearrow \quad \downarrow \quad \nearrow \\ \bullet \quad \bullet \quad \bullet \\ \downarrow \quad \nearrow \quad \downarrow \quad \nearrow \\ \bullet \quad \bullet \end{array} \quad k_I : \quad \begin{array}{ccccc} k & & k & & 0 \\ \downarrow & \nearrow & \downarrow & \nearrow & \\ k & \circlearrowleft & k & \nearrow & k \\ \downarrow & \nearrow & \downarrow & \nearrow & \downarrow \\ k & & k & & k \end{array}$$

Intervals (2/2)

- A full subposet I of P is called *interval* if I is
 - (1) connected (the Hasse diagram of I is connected),
 - (2) convex ($x \leq y \leq z$, and $x, z \in I$ imply $y \in I$).
- For an interval I of P , the *interval module* k_I is defined by
 $k_I(p) := k$ for $p \in I$, otherwise $k_I(p) := 0$,
 $k_I(a \rightarrow b) := \text{id}_k$ for $a, b \in I$, otherwise 0.
- A module is *interval decomposable* if the module decomposes into interval modules.

$$I \subset P : \quad \begin{array}{c} \bullet \\ \downarrow \quad \nearrow \quad \downarrow \quad \nearrow \\ \bullet \quad \bullet \quad \bullet \\ \downarrow \quad \nearrow \quad \downarrow \quad \nearrow \\ \bullet \end{array} \quad k_I : \quad \begin{array}{ccccc} k & & k & & 0 \\ \downarrow & \nearrow & \downarrow & \nearrow & \\ k & \circlearrowleft & k & \nearrow & k \\ \downarrow & \nearrow & \downarrow & \nearrow & \downarrow \\ k & & k & & k \end{array}$$

Question

P : Posets of type A

Modules over P are interval decomposable
(by Gabriel's theorem).

$\bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet \rightarrow \bullet$

$\bullet \longleftrightarrow \bullet \longleftrightarrow \bullet \longleftrightarrow \bullet \longleftrightarrow \bullet$

$$V \cong \bigoplus_{i=1}^n I[b_i, d_i]^{m_{b_i, d_i}}$$

P : ?

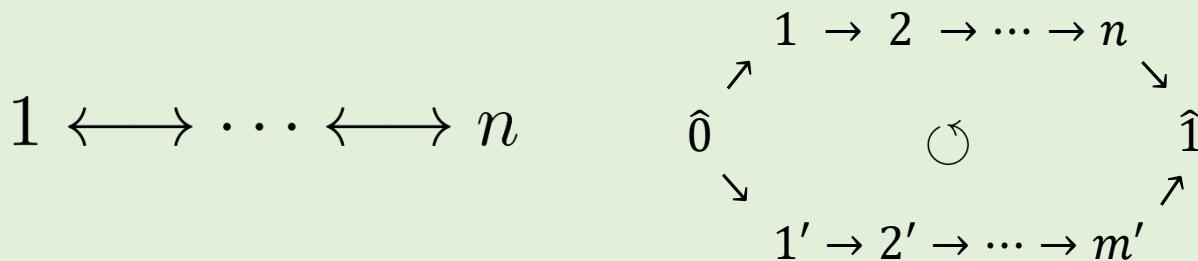

Modules over P are interval decomposable.

Theorem 1 [Aoki-Escolar-T]

Let P be a connected finite poset. The following are equivalent.

- (a) Every module over P is interval decomposable.
- (b) The Hasse diagram of P is one of the following form:

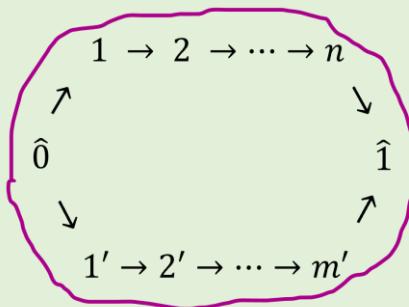

$A_n(a)$

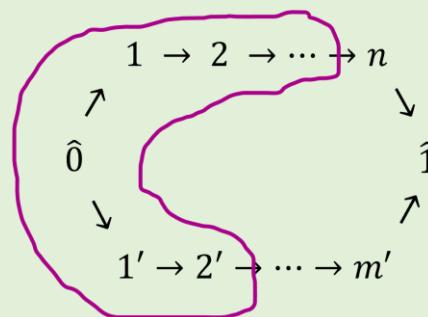

$C_{n,m}$: bipath poset of size (n, m)
~~(commutative cycle)~~

Theorem 1 [Aoki-Escolar-T]

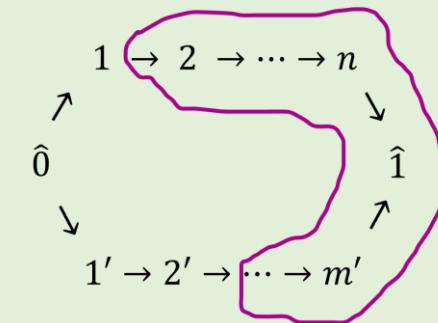

In particular, the intervals in $C_{n,m}$ are following forms.

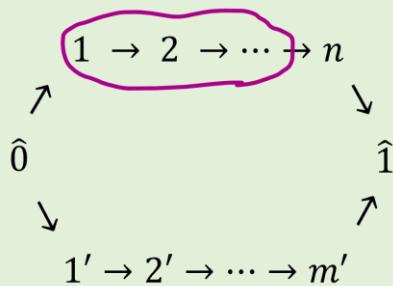

$\hat{0} \in I, \hat{1} \in I$ (all)

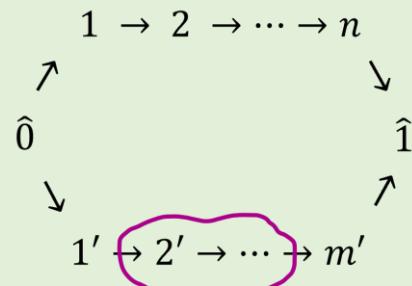

$\hat{0} \in I, \hat{1} \notin I$

$\hat{0} \notin I, \hat{1} \in I$

$\hat{0} \notin I, \hat{1} \notin I$

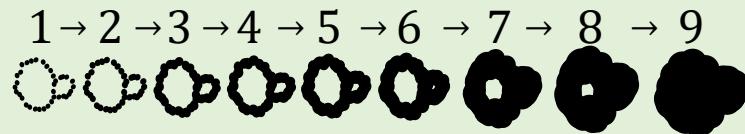

$\hat{0} \notin I, \hat{1} \notin I$

The number of intervals is

$$\frac{n^2 + 4nm + m^2 + 5n + 5m + 6}{2}.$$

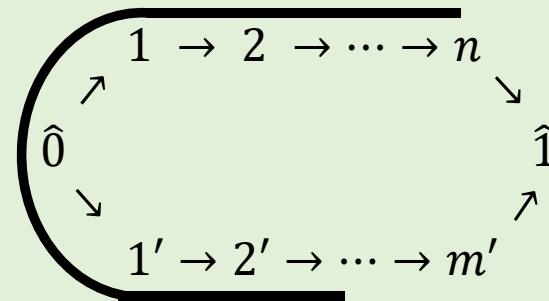

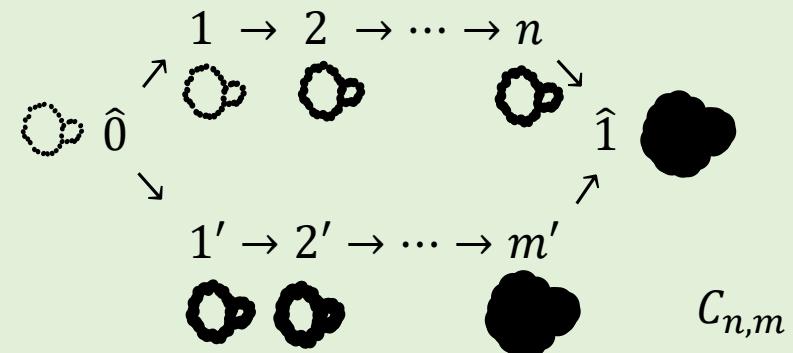

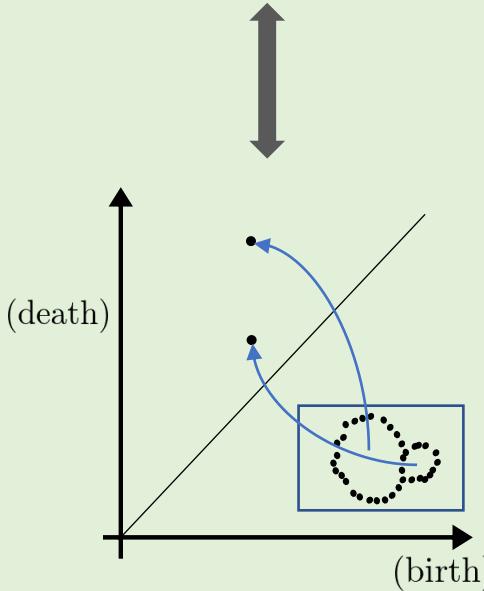

* We give a sketch of proof of Theorem 1 after in Theorem 3.

Comparison between type A and $C_{n,m}$

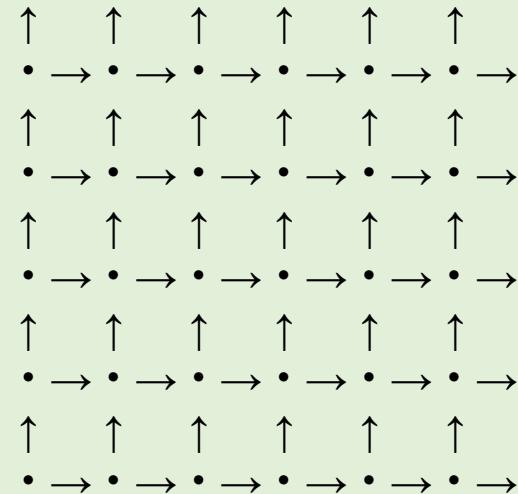

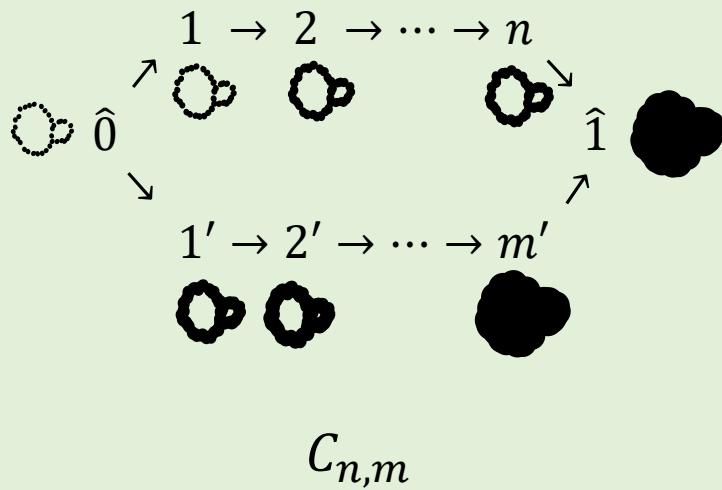

$A_n(a)$

$1 \rightarrow 2 \rightarrow 3 \rightarrow 4 \rightarrow 5 \rightarrow 6 \rightarrow 7 \rightarrow 8 \rightarrow 9$

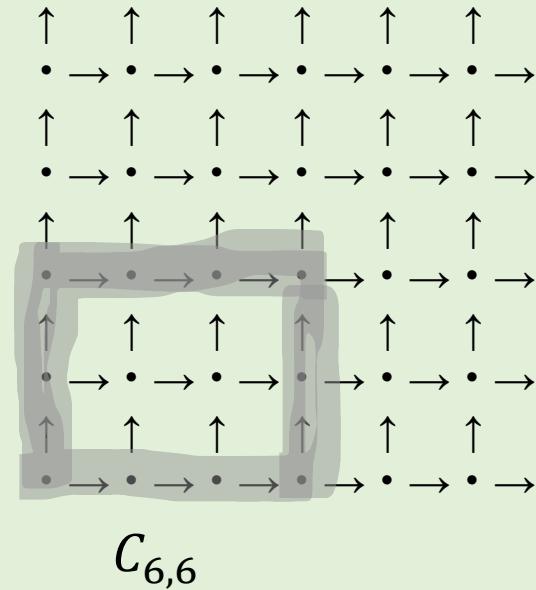

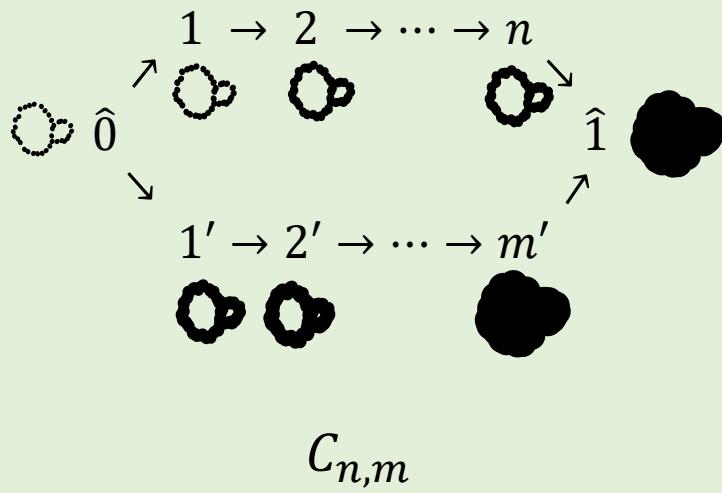

?

Idea for application of $C_{n,m}$

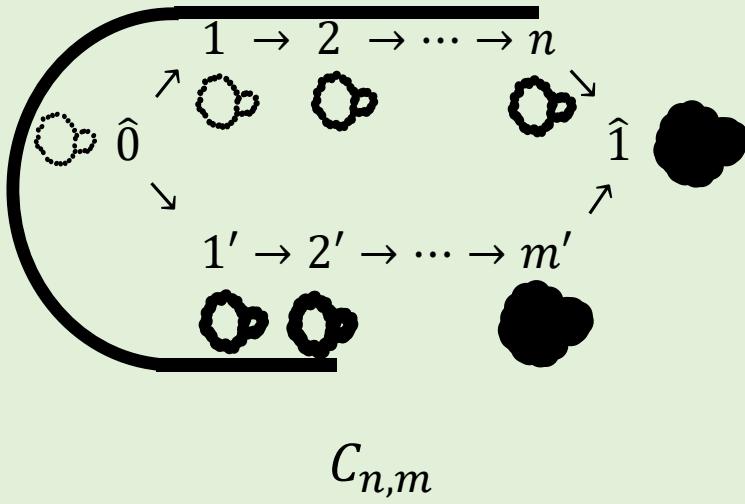

- We can get a part of information of multi-parameter persistence modules by restricting multi-filtration to $C_{n,m}$ (like fibered barcode?).
- By using two functions, we can see the robustness of shape of data in terms of the two functions .

Idea for application of $C_{n,m}$

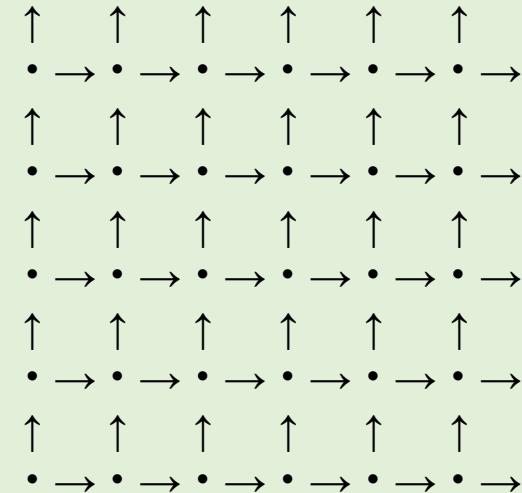

- We can get a part of information of multi-parameter persistence modules by restricting multi-filtration to $C_{n,m}$ (like fibered barcode?).
- By using two functions, we can see the robustness of shape of data in terms of the two functions .

Idea for application of $C_{n,m}$

$C_{n,m}$

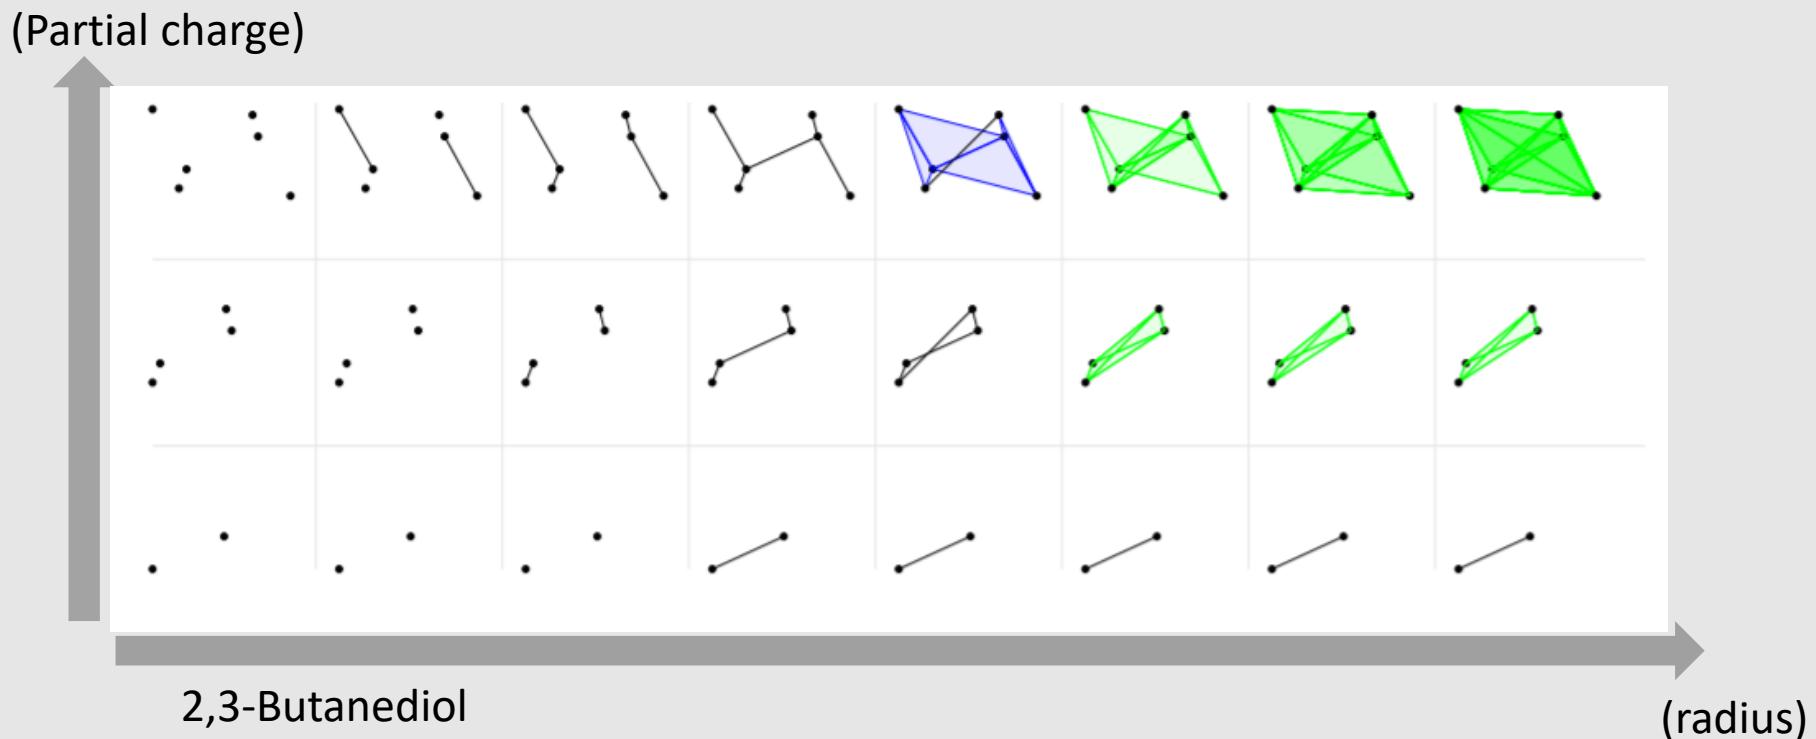

$C_{6,6}$

- We can get a part of information of multi-parameter persistence modules by restricting multi-filtration to $C_{n,m}$ (like fibered barcode?).
- By using two functions, we can see the robustness of shape of data in terms of the two functions .

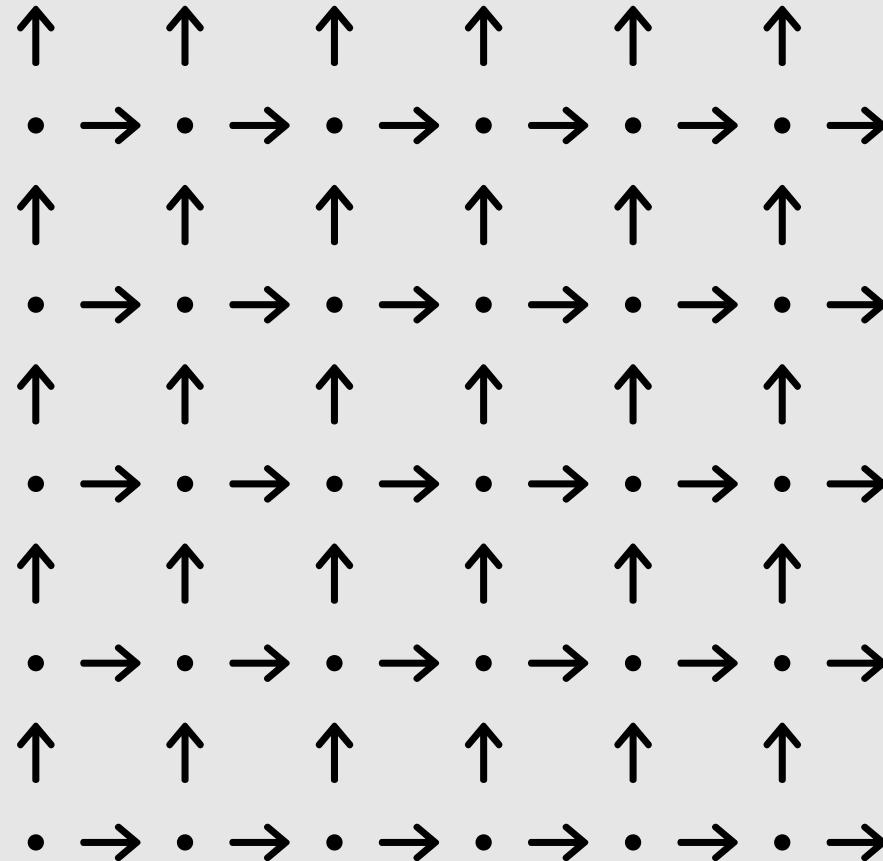

Results

- (1)Classification of posets
- (2)Direct summand injectivity
- (3)Monotonicity

Multi-parameter persistent homology

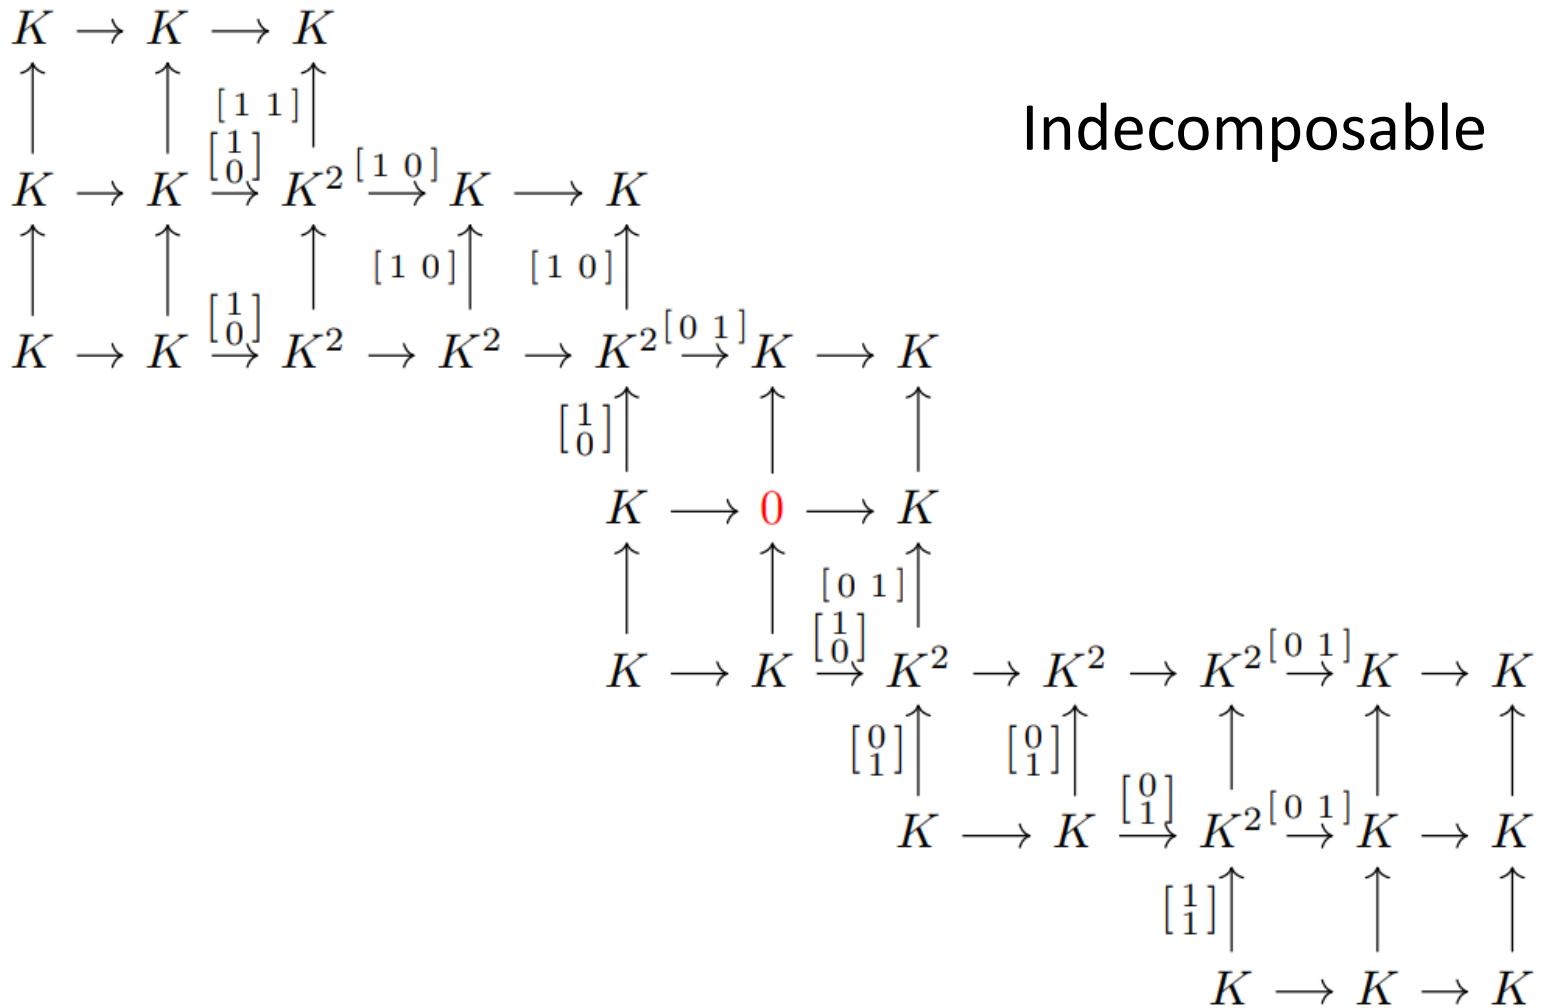

Multi-parameter persistent homology

It is difficult to classify all the indecomposable module
(wild representation type)

Multi-parameter persistent homology

M.Buchet, Emerson G. Escolar “Every 1D Persistence Module is a Restriction of Some Indecomposable 2D Persistence Module” *Journal of Applied and Computational Topology*

$$\begin{array}{ccc}
 & \begin{matrix} 1 \rightarrow 2 \rightarrow \cdots \rightarrow n \\ \hat{0} & \textcirclearrowleft & \hat{1} \\ \uparrow & & \downarrow \\ 1' \rightarrow 2' \rightarrow \cdots \rightarrow m' \end{matrix} & \\
 1 \longleftrightarrow \cdots \longleftrightarrow n & & C_{n,m}
 \end{array}$$

(Modules are always interval decomposable)

We want to understand complex modules (obtained from data) over posets, using “good” modules (interval modules).

Interval approximation

- Benjamin Blanchette, Thomas Brüstle, and Eric J Hanson. “Homological approximations in persistence theory.” *Canadian Journal of Mathematics*, pages 1–38, 2021.
- Hideto Asashiba, Emerson G Escolar, Ken Nakashima, and Michio Yoshiwaki. “Approximation by interval-decomposables and interval resolutions of persistence modules.” *Journal of Pure and Applied Algebra*, 227(10):107397, 2023.

Interval approximation (1/1)

- \mathcal{I}_P is the set of interval decomposable modules over P .
- M is a module over P .

An *interval approximation* of M is a morphism $f:J \rightarrow M$ with $J \in \mathcal{I}_P$ s. t. for any $g:I \rightarrow M$ with $I \in \mathcal{I}_P$ factor through f .

$$\begin{array}{ccc} \mathcal{I}_P \ni & I & \\ & \downarrow \exists & \\ \mathcal{I}_P \ni & J & \xrightarrow{f} M \\ & \text{--->} & \end{array}$$

$\forall g$

```
graph TD; I["I"] -- "factors through f" --> J["J"]; J -- "self-loop" --> J; J -- "f" --> M["M"]; g["g"] -- "forall g" --> M;
```

An *interval cover* of M is an interval approximation such that the number of direct summands of the domain is smaller than that of other interval approximations (uniquely determined).

Question

How can we calculate interval cover of any modules (easily)?

Question

How can we calculate interval cover of any modules (easily)?

Calculation of interval cover of a module M

- (1) We have an interval approximation $\bigoplus_{I \in \mathbb{I}(P)} k_I^{m_I} \rightarrow M$, where m_I is k -dimension of $\text{Hom}_k(k_I, M)$ and $\mathbb{I}(P)$ is the set of all the intervals in the poset P .
- (2) We reduce the direct summands of the above interval approximation until we obtain the interval cover.

We give a helpful observation to the Question.

Theorem 2 [Aoki-Escolar-T]

Let P be a finite poset and M be a module over P . For any interval cover of M

$$f = (f_i) : \bigoplus_{i=1}^n k_{I_i} \rightarrow M,$$

the following holds.

- (1) f is surjective.
- (2) Each $f_i : k_{I_i} \rightarrow M$ is injective.
- (3) For every $a \in P$, we have $M(a) = 0$ if and only if $\left(\bigoplus_{i=1}^n k_{I_i}\right)(a) = 0$.

In particular, every k_{I_i} is given by an interval submodule of M .

Remark

Recently, [Asashiba, 2023, Proposition 4.8, arXiv:2307.06559] gave the essentially same result (see also [Blanchette-Brüstle-Hanson, Proposition 6.7, 2021, Canadian Journal of Mathematics, 1-38]).

Results

- (1)Classification of posets
- (2)Direct summand injectivity
- (3)Monotonicity

Resolution dimension (1/2)

- An *interval resolution* of M is an exact sequence

$$0 \rightarrow J_m \xrightarrow{g_m} \cdots \rightarrow J_2 \xrightarrow{g_2} J_1 \xrightarrow{g_1} J \xrightarrow{f} M \rightarrow 0,$$

$\cdots K_3 \xrightarrow{\iota_3} K_2 \xrightarrow{f_2} K_1 \xrightarrow{\iota_2} K_2 \xrightarrow{f_1} K_1 \xrightarrow{\iota_1} K_2$

then we say that the *interval resolution dimension* of M is m and write $\text{int-res-dim } M = m$.

Interval resolution global dimension (2/2)

- *interval resolution global dimension* of P is

$$\text{int-res-gldim}(P) := \sup\{\text{int-res-dim}(M) \mid M: \text{modules over } P\}$$

* [Asashiba-Escolar-Nakashima-Yoshiwaki, 23] show that
 $\text{int-res-gldim}(P) < \infty$ for any poset finite poset P .

Interval resolution global dimension (2/2)

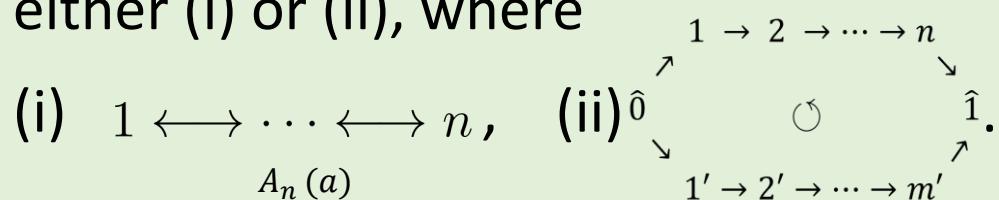

- *interval resolution global dimension of P is*

$$\text{int-res-gldim}(P) := \sup\{\text{int-res-dim}(M) \mid M: \text{modules over } P\}$$

* [Asashiba-Escolar-Nakashima-Yoshiwaki, 23] show that $\text{int-res-gldim}(P) < \infty$ for any poset finite poset P .

Remark

$\text{int-res-gldim}(P)$ is zero if and only if the Hasse diagram of P is either (i) or (ii), where

Theorem 3 [Aoki-Escolar-T]

Let P be a finite poset. For any full subposet Q of P , the following inequality holds.

$$\text{int-res-gldim}(Q) \leq \text{int-res-gldim}(P).$$

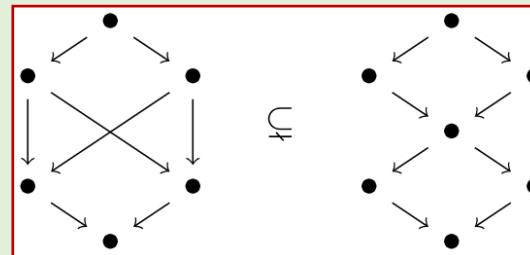

Theorem 3 [Aoki-Escolar-T]

Let P be a finite poset. For any full subposet Q of P , the following inequality holds.

$$\text{int-res-gldim}(Q) \leq \text{int-res-gldim}(P).$$

Remark

The above monotonicity **does not hold** for (usual) global dimension in general [Igusa-Zacharia, 1990].

Poset	Q	\subset	P
Global dimension	3	>	2
Interval global dimension	1	<	2 (over a field with two elements)

Theorem 1 [Aoki-Escolar-T]

Let P be a connected finite poset. The following are equivalent.

- (a) Every module over P is interval decomposable.
- (b) The Hasse diagram of P is $1 \longleftrightarrow \cdots \longleftrightarrow n$ or

$$A_n(a) \quad \text{or} \quad \begin{array}{c} 1 \rightarrow 2 \rightarrow \cdots \rightarrow n \\ \hat{0} \uparrow \downarrow \circlearrowleft \hat{1} \\ 1' \rightarrow 2' \rightarrow \cdots \rightarrow m' \end{array} C_{n,m}.$$

Sketch of proof ($a \Rightarrow b$)

- The Hasse diagram of P does not have a vertex with degree 3 (by Theorem 3).
- P is either A_n or \tilde{A}_m for some n and m .
- P must be A_n or $C_{n,m}$ for some n and m .

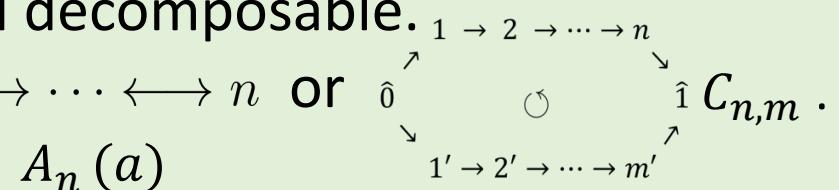

$$\begin{array}{ccc} \bullet & \xleftarrow{\quad \downarrow \quad} & \bullet \\ k & \downarrow & [1] \\ k & \xleftarrow{\quad k^2 \quad} & k \\ [1,0] & & [0,1] \end{array}$$

※ We prove the converse (interval decomposability of module over $C_{n,m}$) by using theory of special biserial algebra.

Theorem 1 [Aoki-Escolar-T]

Let P be a connected finite poset. The following are equivalent.

- (a) Every module over P is interval decomposable.
- (b) The Hasse diagram of P is $1 \longleftrightarrow \cdots \longleftrightarrow n$ or

A_n (a)

Sketch of proof ($a \Rightarrow b$)

- The Hasse diagram of P does not have a vertex with degree 3 (by Theorem 3).
- P is either A_n or \tilde{A}_m for some n and m .
- P must be A_n or $C_{n,m}$ for some n and m .

$$1 \longleftrightarrow \cdots \longleftrightarrow n : A_n$$

A Hasse diagram for the poset \tilde{A}_m . It shows a central node labeled $m+1$ with two arrows pointing to it from nodes labeled m and 1 . Below this, there is a horizontal chain of nodes labeled $1 \longleftrightarrow \cdots \longleftrightarrow m$.

$$1 \longleftrightarrow \cdots \longleftrightarrow m : \tilde{A}_m$$

※ We prove the converse (interval decomposability of module over $C_{n,m}$) by using theory of special biserial algebra.

Summary

- (1) We classified finite posets whose modules are always interval decomposable.
- (2) We show that restriction of each direct summand of interval cover is injective.
(It makes calculation of interval cover easier.)
- (3) We show the monotonicity of int-res-gldim.
(This is used to show the first result.)

Discussion

- When $C_{n,m}$ is useful in TDA? Stability?
- Does int-res-gldim depend on the characteristic of fields?
- When do we have $\text{int-res-gldim}(Q) = \text{int-res-gldim}(P)$ for $Q \subset P$?
- Can we calculate interval cover easily?
- Computation using GAP package QPA (“Quiver and Path Algebras”) and “pmgap” by E. G. Escolar to calculate modules over poset.

Thank you for your attention!
